Preface

As the 1994 standard drawings have been in effect for a long time, some parts have become outdated in terms of design and material standards or are inconsistent with current practice. In addition, construction technology has progressively developed and changed. Revisions and additions of standard drawings have been successively approved. Therefore, it is necessary to compile, revise and prepare new standard drawings so as to improve highway safety and support truck weight limit changes by implementing the current advanced technologies and innovation in design and construction for enhanced efficiency in highway development. This 2015 revision of standard drawings has thus been prepared, with the following improvements/developments.

- Update of design-related standards and references to be consistent with the standards of Department of Highways (DOH) and international standards
- Update of construction materials and reference to the standards consistent with current practice
- Design revision to reduce construction and maintenance problems and obstacles
- Addition of new typical drawings to cover every part of work, drawing set organization for easy use, etc.

This edition of standard drawings presents general typical drawings to be adopted as operational guidelines or recommendations for all DOH's divisions and sections for detailed design and construction works so that proper standards are consistently adopted throughout the country. The use of standard drawings shall be at the designer's discretion and judgement in selecting appropriate drawings or modifying the details to be suitable for the actual conditions of each site. Contractors and construction supervisors shall adopt these standard drawings as implementation guidelines so that the construction works shall be standardized throughout the country.

This 2015 revision of standard drawings comprise 2 drawing sets: 1) standard drawings for highway construction, which are presented in this document, and 2) standard drawings for construction of large bridges and others.

The standard drawings for highway construction consist of 2 parts as follows:

1) Standard drawings for road work, comprising 8 divisions: typical cross section / geometric and general design / traffic sign, marking and safety devices / drainage systems / slope stability and erosion protection / highway environmental and handicap sidewalks / roadway lighting / road traffic signals;
2) Standard drawings for structural work, comprising 4 divisions: bridges with span not more than 20 meters / bridge accessories / reinforced concrete box culverts / retaining walls

The Department of Highways' mission involves a large number of design and construction projects spatially located all over the country, with diverse topographical conditions, obstacles, and details of problems. Consequently, it is not possible to prepare designs for all issues. To use the standard drawings, designers, contractors, and construction supervisors must draw upon their knowledge and experience, and study the details presented in each drawing, both the design and specifications, in order to thoroughly understand the objectives, recommendations and constraints before using the drawings or improving the details to suit the site conditions. This will result in correct and standardized design and construction works that can be efficiently and sustainably implemented.

Furthermore, a manual of standard drawings is produced as a separate document for ease of use, explaining the objectives, recommendations for use of drawings, constraints on the use as well as examples of complex designs in brief.

It is expected that the 2015 updated standard drawings will significantly contribute to the operational efficiency of all the Department of Highways' divisions and sections.

TYPICAL FOR 2–LANE HIGHWAY

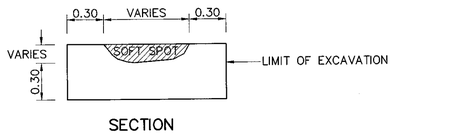

SCALE 1 : 100

NOTES:

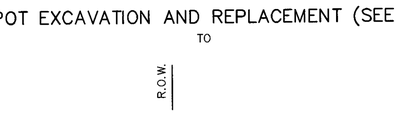

1. ALL DIMENSIONS ARE IN METERS UNLESS OTHERWISE INDICATED
2. THE NUMBERS OF THE BENCHING DEPEND ON THE HEIGHT OF THE EXISTING EMBANKMENT. OR EXISTING GROUND LEVEL.
3. PORTION "A" SHALL DIRECTED BY THE ENGINEER.
4. PORTION "B" SHALL BE WIDEN ENOUGH FOR COMPACTION BY COMPACTION EQUIPMENT.
5. THE CORRECTIVE MEASURE OF SOFT SPOT ON THE EXISTING ROADWAY MUST BE DONE BEFORE THE CONSTRUCTION OF THE NEW OVERLAYING PAVEMENT, THE SOFT SPOT SHALL BE OBSERVED BY THE MOVEMENT OF THE EXISTING SURFACE WHEN USING COMPACTOR UNIT WEIGHTING AT LEAST 6 METRIC TONS RUNS OVER ALONG THE SECTION.
6. THE BENCHING CUT FOR EXTENDING THE NEW ROADWAY SHALL BE DONE FROM THE EDGE OF THE EXISTING ROADWAY, WHILE THE NEW FILL MATERAIL SHALL BE APPLIED AS SOON AS POSSIBLE TO PREVENT CRACKING OF THE BENCHING.
7. SIDE BORROW ARE NOT ALLOWED.
8. BEFORE CONSTRUCTING PAVEMENT STRUCTURE, IF GROUND WATER SEEPAGE APPEARS ON CUT SLOPE AND SEEMS TO CAUSE DAMAGE TO THE ROADWAY, THE SUBDRAIN AS SHOWN ON THE DRAWING SHALL BE APPLIED.
9. THIS DRAWING IS GUIDANCE ONLY. THE DIMENSION AND LOCATION OF UTILITIES MAY BE ADJUSTED TO SUIT FOR THE FIELD CONDITION OR PARTICULAR PURPOSE.
10. IF HEIGHT OF FILL OR CUT MORE THAN 5 METERS FROM EXISTING GROUND ; THIS DRAWING SHALL BE USED IN COMBINATION WITH STD. DWG. NO. TS–401.
11. FILL AND CUT SLOPE CONSTRUCTION IN VARIOUS HEIGHT ACCORDING TO TABLE I IS GUIDANCE ONLY, IT SHOULD BE CONFIRMED WITH SPECIFIC INFORMATION ON SOIL AND GEOLOGY PARAMETERS IN THE FIELD. FURTHERMORE,THE SLOPE STABILITY ANALYSIS SHALL BE RECOMMENDED BY THE ENGINEER.
12. THE LOCATION OF THE PROPOSED 2–LANE ROADWAY SHALL BE CONSIDERED AS THE FIRST STAGE OF CONSTRUCTION WHICH HAS TO BE CONFORMED TO FUTURE STAGE FOR ADDITIONAL HIGHWAY WIDENING
13. THE PAVEMENT STRUCTURE AND OTHER DETAILS WHICH ARE NOT SPECIFIED IN THIS DRAWING SHALL BE REFERED TO THE TYPICAL CROSS–SECTION DESIGN DRAWINGS.
14. THE GENERAL SPECIFICATIONS FOR PAVEMENT CONSTRUCTION MATERIAL ARE SHOWN ON THE TABLE II.
15. S1 = NORMAL CROSS SLOPE AS SHOWN ON THE TYPICAL–CROSS SECTION.
16. THE INVERT OF SIDE DITCH SHALL BE LOWER THAN THE PROFILE GRADE TO 1.20 M. MOREOVER, THESE INVERT ELEVATION MAY BE ADJUSTED IN THE FIELD TO SUIT FOR ACTUAL SUCCESSIVE FLOW.
17. THE ELEMENT OF TYPICAL SECTION SHALL BE ADJUSTED AND CONSIDERED FOR OTHER FUNCTIONS REQUIRED AS DIRECTED BY THE ENGINEER

(SU DESIGN VEHICLE, CONTROL RADIUS OF 15.00 M.)

NOT TO SCALE

REMARK :

IN GENERAL, MEDIAN OPENINGS LONGER THAN 25.00 M. SHOULD BE AVOIDED, REGARDLESS OF SKEW THIS PLAN MAY CALL FOR SPECIAL CHANNELIZATION, RIGHT–TURN LANES, OR ADJUSTMENT TO REDUCE THE CROSSROAD SKEW, ALL OF WHICH RESULT IN ABOVE–MINIMUM DESIGNS.

MINIMUM DESIGN OF MEDIAN OPENINGS
(EFFECT OF SKEW)

NOT TO SCALE

NOTES :

1. MEDIAN OPENING SHOULD BE 3–5 KM. INTERVAL FOR RURAL AREAS WITH VILLAGE 1.5 KM. (MINIMUM) LONG IN THE INTERVAL.
2. MEDIAN OPENING IN URBAN AREAS SHOULD BE 250 M. (MINIMUM) INTERVAL (FOR THE LARGE CITY).

REMARKS :

1. FOR A MEDIAN WIDTH OF 3.00 M. OR MORE THE BULLET NOSE IS SUPERIOR TO THE SEMICIRCULAR END AND PREFERABLY SHOULD BE USED IN DESIGN.
2. FOR ANY THREE–OR–FOUR–LEG INTERSECTION ON A DIVIDED HIGHWAY THE LENGTH OF MEDIAN OPENING SHOULD BE AS GREAT AS THE WIDTH OF CROSSROAD ROADWAY PAVEMENT PLUS SHOULDER AND IN NO CASE LESS THAN 16.80 M. (OR LESS THAN THE CROSSROAD PAVEMENT PLUS 2.40 M.) WHERE THE CROSSROAD IS A DIVIDED HIGHWAY, THE LENGTH OF OPENING SHOULD BE AT LEAST EQUAL TO THE WIDTH OF THE CROSSROAD ROADWAYS PLUS THAT OF THE MEDIAN PLUS 2.40 M.
3. THE USED OF A 16.80 M. MINIMUM LENGTH OF OPENING WITHOUT REGARD TO THE WIDTH OF MEDIAN OR THE CONTROL RADIUS SHOULD NOT BE CONSIDERED EXCEPT AT VERY MINOR CROSSROADS. THE MINIMUM LENGTH OF OPENING FOR U–TURNS, AS DISCUSSED ELSEWHERE.

ABOVE–MINIMUM DESIGN OF MEDIAN OPENINGS
(TYPICAL BULLET NOSE ENDS)

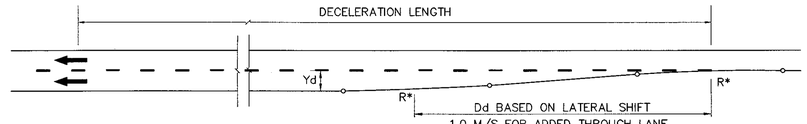

NOT TO SCALE

REMARKS :

1. RADIUS R1 MAY VARY FROM ABOUT 25.00–120.00 M.OR MORE THE TABULATED VALUES SHOWN, 30.00 M., 50.00 M. AND 70.00 M. ARE ESTABLISHED MINIMUM RADII FOR TURNING SPEEDS OF 30, 40, AND 50 KPH. RESPECTIVELY.
2. TO AVOID A LARGE OPENING, R SHOULD BE HELD TO A REASONABLE MINIMUM, EG, 15.00 M, AS USED IN FIGURE.
3. THE LENGTH OF MEDIAN OPENING IS GOVERNED BY THE RADII. FOR MEDIANS WIDER THAN ABOUT 9.00 M. COUPLED WITH A CROSSROAD OF FOUR OR MORE LANES, THE CONTROL RADIUS R GENERALLY WILL NEED TO BE GREATER THAN 15.00 M. OR THE MEDIAN OPENING WILL BE TOO SHORT.

REMARK :

THE LENGTH OF THESE LANES IN RURAL AREAS IS GENERALLY BASED ON DECELERATION CONSIDERATIONS. HOWEVER, IN URBAN AREAS WHERE TRAFFIC SPEEDS ARE SIGNIFICANTLY LOWER AND RIGHT–OF–WAY MORE RESTRICTIVE, THE LENGTH MAY BE DICTATED MORE BY VEHICLE STORAGE REQUIREMENTS, PARTICULARLY AT TRAFFIC SIGNAL CONTROLLED INTERSECTIONS AT LOCATIONS WHERE A FULL LENGTH DECELERATION LANE CANNOT BE PROVIDED, A MINIMUM TREATMENT (EG. 30.00 M. TAPER PLUS 30.00 M. PARALLEL LANE) CAN STILL PROVIDE SIGNIFICANT BENEFITS. THE TOTAL LENGTH REQUIRED FOR DECELERATION LANES IS GIVEN IN TABLE. THIS LENGTH IS PROVIDED BY MEANS OF A TAPER AND A PARALLEL LANE THE LENGTH OF TAPER ADOPTED IS TYPICALLY 50.00 M. RURAL, 30.00 M. URBAN, OR LESS THE LENGTH OF DECELERATION LANE ON GRADE IS DETERMINED BY MULTIPLYING THE LENGTH WITH CORRECTION FACTOR FOR GRADE.

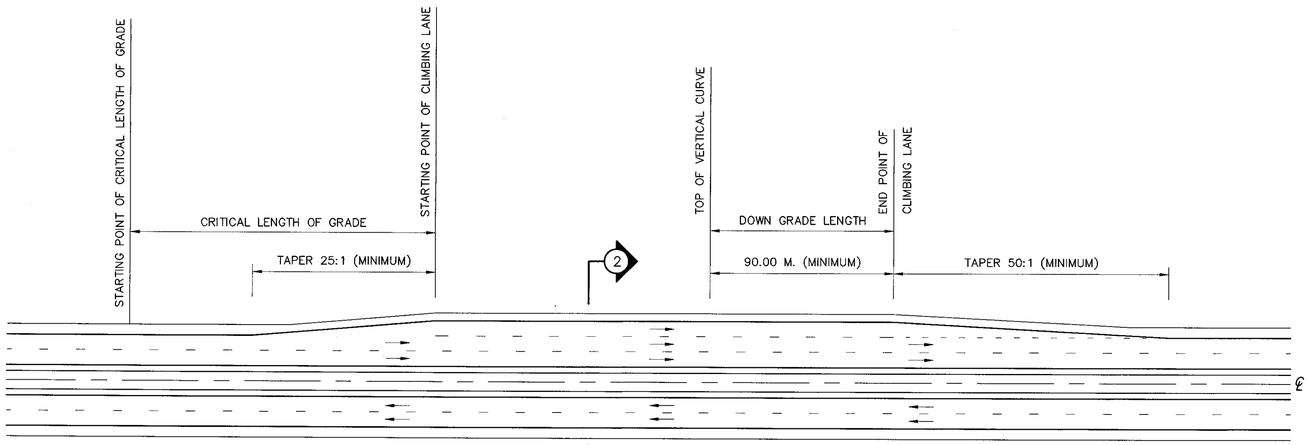

FIGURE 2 CLIMBING LANE PLAN FOR MULTILANE HIGHWAYS (ONLY ON UPGRADE DIRECTION)

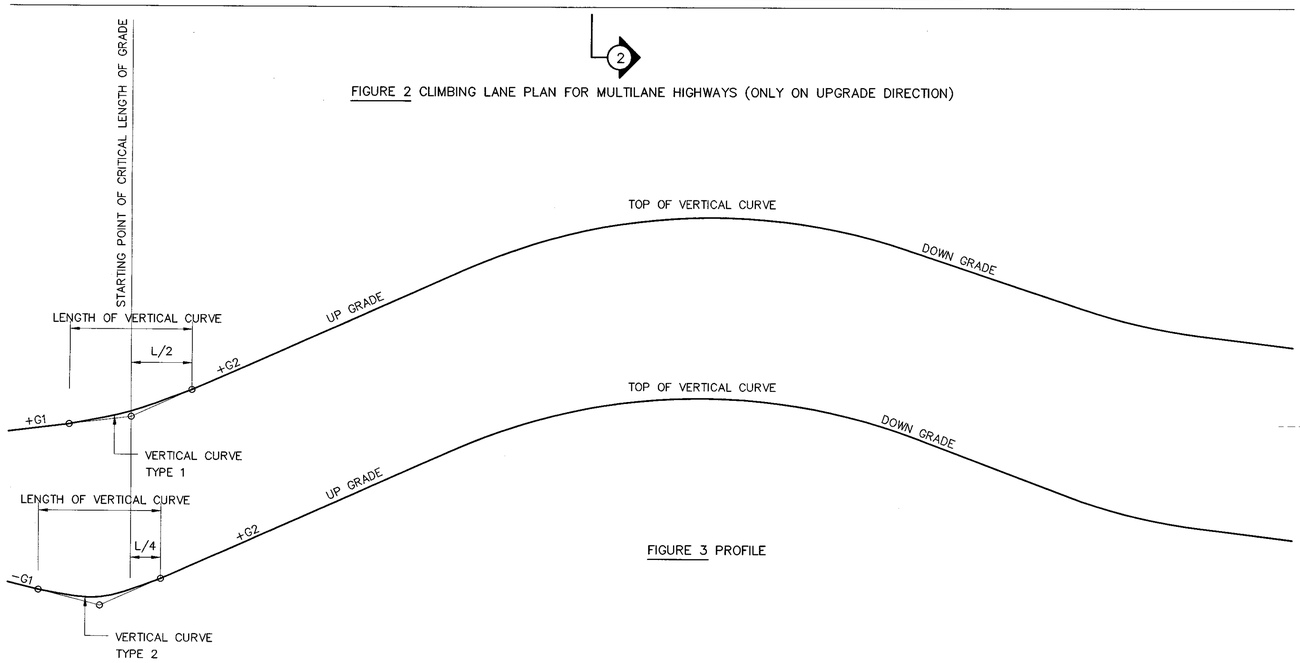

FIGURE 3 PROFILE

CLIMBING LANE FOR 2–LANE HIGHWAYS

1. CONDITION AND CRITERIA

   THE FOLLOWING THREE CONDITIONS AND CRITERIA, REFLECTING ECONOMIC CONSIDERATION, SHOULD BE SATISFIED TO JUSTIFY A CLIMBING LANE :

   1.1 UPGRADE TRAFFIC FLOW RATE IN EXCESS OF 200 VEHICLES PER HOUR.

   1.2 UPGRADE TRUCK FLOW RATE IN EXCESS OF 20 VEHICLES PER HOUR.

   1.3 ONE OF THE FOLLOWING CONDITIONS EXISTS ON UPGRADE (CRITICAL LENGTH OF GRADE)

   – A 15 KPH. SPEED REDUCTION IS EXPECTED FOR A TYPICAL HEAVY TRUCK ON MAJOR ARTERIAL HIGHWAY OR MOTORWAY AND SPEED REDUCTION > 15 KPH. – 40 KPH. IS EXPECTED FOR A TYPICAL HEAVY TRUCK ON OTHER HIGHWAYS AS DIRECTED BY THE ENGINEER.

   – LEVEL OF SERVICE OF TRAFFIC FLOW DROPS TO LEVEL E OR F.

2. THESE GENERAL GUIDES FOR THE CONSIDERATION OF CLIMBING LANES ON GRADES WOULD APPLY ONLY TO CLIMBING LANES ON TWO–LANE HIGHWAYS AND SHOULD NOT BE USED IN CONJUNCTION WITH CONSIDERATION OF CLIMBING LANES ON MULTILANE HIGHWAYS.
3. THE CRITICAL LENGTH OF GRADE IN FIGURE IS DERIVED AS THE LENGTH OF TANGENT GRADE. WHERE A VERTICAL IS PART OF A CRITICAL LENGTH OF GRADE, AN APPROXIMATE EQUIVALENT TANGENT GRADE LENGTH MUST BE USED. WHERE THE CONDITION INVOLVES VERTICAL CURVE TYPE I AND THE ALGEBRAIC DIFFERENCE IN GRADES IS NOT TOO GREAT. THE MEASUREMENT OF CRITICAL LENGTH OF GRADE MAY BE MADE BETWEEN THE POINT OF VERTICAL INTERSECTION (PVI.). WHERE VERTICAL CURVE OF TYPE II IS INVOLVED. PARTICULARLY WHERE THE ALGEBRAIC DIFFERENCE IN GRADE IS APPRECIABLE. ABOUT ONE–QUARTER OF THE VERTICAL CURVE LENGTH MAY BE CONSIDERED AS PART OF THE GRADE UNDER CONSIDERATION.
4. THE BEGINNING POINT OF CLIMBING LANE IS THE POINT WHERE THE CONDITION OF TRAFFIC OPERATION EXISTS AS STATED IN 1.3.
5. THE END POINT OF CLIMBING LANE IS THE POINT WHERE THE TRUCK CAN RETURN TO THE NORMAL LANE WITHOUT UNDUE HAZARD IN PARTICULAR. WHERE THE SIGHT DISTANCE BECOMES SUFFICIENT TO PERMIT PASSING WITH SAFETY WHEN THERE IS NO ONCOMING TRAFFIC OR ,PREFERABLY, AT LEAST 90.00 M. BEYOND THE CREST POINT (EXCLUDING TAPER LENGTH OF LANE DROPS).
6. CLIMBING LANE WIDTH SHALL BE THE SAME WITH THE MAIN TRAFFIC LANE AND THE SHOULDER WIDTH SHALL BE VARIED (1.00 M. MIN.) IF THE TOPOGRAPHY IS RESTRICTED.
7. DIMENSION ARE IN METERS UNLESS OTHERWISE INDICATED.

CLIMBING LANE FOR MULTILANE HIGHWAYS

1. CONDITION AND CRITERIA

   1.1 IF THE CRITICAL LENGTH OF GRADE, THE LENGTH OF A PARTICULAR UPGRADE WHICH REDUCES THE OPERATING SPEED OF TRUCKS 15 KPH. BELOW THE OPERATING SPEED OF THE REMAINING TRAFFIC IS LESS THAN THE LENGTH OF GRADE BEING STUDIED, A CLIMBING LANE IS WARRANTED.

   1.2 IF THE FLOW RATE ON THE GRADE EXCEEDS THE SERVICE FLOW RATE OF THE NEXT POORER LEVEL OF SERVICE, A CLIMBING LANE IS WARRANTED.

   1.3 IF THE UPGRADE DIRECTIONAL TRAFFIC VOLUME IS EQUAL TO OR GREATER THAN THE SERVICE VOLUME FOR LEVEL OF SERVICE D , A CLIMBING LANE IS WARRANTED.

2. IN MOST CASES WHEN THE SERVICE VOLUME, INCLUDING TRUCK, IS GREATER THAN 1,700 VPH. AND THE LENGTH OF THE GRADE AND THE PERCENTAGE OF TRUCKS ARE SUFFICIENT TO CONSIDER CLIMBING LANES, THE VOLUME IN TERMS OF EQUIVALENT PASSENGER CARS IS LIKELY TO APPROACH OF EVEN EXCEED THE CAPACITY. AN INCREASE IN THE NUMBER OF LANES THROUGHOUT THE HIGHWAY SECTION WOULD REPRESENT A BETTER INVESTMENT THAN THE PROVISION OF CLIMBING LANES.
3. A CLIMBING LANE IS ALSO GENERALLY NOT WARRANTED ON FOUR–LANE HIGHWAYS FOR A DIRECTION SERVICE VOLUME BELOW 1,000 VPH. REGARDLESS OF THE PERCENTAGE OF TRUCK.
4. WHEN THE ANALYSIS INDICATES THAT A CLIMBING LANE MAY IMPROVE OPERATIONS OR MAINTAIN THE LEVEL OF SERVICE ON THE SECTION WITH A GRADE ; FURTHERMORE, AN ADDITIONAL CHECK MUST BE MADE TO DETERMINE IF THE NUMBER OF LANES REQUIRED ON THE GRADE ARE SUFFICIENT EVEN WITH A CLIMBING LANE.
5. THE PRINCIPLES FOR CROSS SLOPES, FOR LOCATING TERMINAL POINTS, AND FOR DESIGNING TERMINAL AREAS OR TAPERS FOR CLIMBING LANES ON TWO–LANE HIGHWAYS ARE EQUALLY APPLICABLE TO CLIMBING LANES ON MULTILANE FACILITIES. THE PRIME FACTOR BEING THAT OF DETERMINING THE LOCATION OF THE UPHILL TERMINUS OF THE CLIMBING LANE AT THE POINT WHERE A SATISFACTORY SPEED IS ATTAINED BY HEAVY TRUCKS, PREFERABLY ABOUT 15 KPH. BELOW THE OPERATING SPEED OF THE HIGHWAY. THE PASSING SIGHT DISTANCE NEED NOT BE CONSIDERED.

1. PUMPING JOINT REPAIRING

1.1 MATERIALS

MATERIALS TO BE MIXED AND COMPRESSED INTO CONCRETE JOINT ARE AS FOLLOW :

1.1.1 SOIL: SOIL SHALL BE SILTY SAND WHICH IS PASSED THROUGH SIEVE NO. 10 (100%) AND SIEVE NO. 200 (0–50%), AND IS NON–PLASTIC METERIAL.

1.1.2 CEMENT: CEMENT SHALL BE TYPE III OR EQUIVALENT.

1.1.3 WATER: WATER WHICH IS USED FOR MIXING WITH SILTY SAND AND CEMENT MUST BE CLEAN.

1.1.4 ADDITIVE: ADDITIVE IS USED TO INCREASE CAPACITY OF FLOWING THROUGH SPACE UNDER THE CONCRETE SLAB. THE ADDITIVE SHOULD HAVE SUITABLE QUALITIES AND WILL BE APPROVED BY THE ENGINEER.

1.1.5 MIXED RATIO: MIXED RATIO OF SLURRY CEMENT MORTAR IS AS FOLLOW:

- SILTY SAND 20 LITERS
- CEMENT 6 LITERS
- WATER 10 LITERS
- ADDITIVE AS NECESSARY

THE MIXED RATIO OF SLURRY CEMENT MORTAR CAN BE ADJUSTED BY THE ENGINEER TO OPTIMUM MIXED RATIO FOR SUITABLE CAPACITY OF FILLING INTO THE SPACE UNDER CONCRETE PAVEMENT.

1.2 WORK PREPARING

STEPS ARE AS FOLLOW:

1.2.1 THE ENGINEER SPECIFIES THE CONCRETE SLABS TO BE REPAIRED. THE CONCRETE SLABS SHOULD HAVE THE SIGN OF DEFLECTION OR THE TRANSVERSE LONGITUDINAL CRACKS THAT CAN BE CLEARLY SEEN.

1.2.2 EACH REPAIRED CONCRETE SLAB SHOULD BE MARKED AS THE DRILLING POSITION IN ORDER TO COMPRESS SLURRY CEMENT MORTAR THROUGH, AS SHOWN IN FIGURE 1.

1.2.3 DRILL THE MARKED POSITION, AS SHOWN IN STEP 1.2.2.

1.2.4 PREPARE THE SET OF SLURRY CEMENT MORTAR MIXER, SLURRY CEMENT MORTAR COMPRESSOR, AND OTHER NECESSARY MATERIALS.

1.3 SLURRY CEMENT MORTAR COMPRESSING

1.3.1 COMPRESS THE SLURRY CEMENT MORTAR INTO THE FIRST HOLE (SHOWN IN FIGURE 1). GENTLY DO IT AT FIRST SO THAT THE CEMENT CAN FLOW FREELY AND REGULARY AND THEN INCREASINGLY COMPRESS THE CEMENT TILL THE MACHINE CAN NO LONGER PRESS. WHILE COMPRESSING THE SLURRY CEMENT MORTAR INTO THE HOLE NO.1, THERE MAY BE SOME SLURRY CEMENT MORTAR SLIPPED INTO AND FILLED THE HOLE NO.2 OR NO.6 AS SHOWN IN FIGURE 1. IF SO, CORK OR PLUG THOSE PARTICULAR HOLES AND DO NOT COMPRESS THE SLURRY CEMENT MORTAR INTO THEM.

1.3.2 MOVE THE COMPRESSOR TO HOLE NO.2 AND DO THE SAME WAY AS TO HOLE NO.1. THEN MOVE TO THE REST OF THE HOLES.

1.3.3 UNCORK OR UNPLUG THE HOLES. SOME HOLES MAY NEED TO BE REFILLED A LITTLE MORE, THEN SHAPE THE HOLES.

1.3.4 LET THE SLURRY CEMENT MORTAR DRY FOR AT LEAST 12 HOURS. THE TRAFFIC SHALL NEED TO BE STOPPED.

1.4 IN THE AREA WHERE HAVING PUMPING AND SLURRY CEMENT MORTAR COMPRESSING UNDERNEATH THE CONCRETE SLAB, THE OLD JOINT SEALER HAS TO BE REMOVED AND REPLACED BY A NEW JOINT SEALER. THE JOINT SEALER SHOILD BE STANDARDIZED AS SUGGESTED BY THE DEPARTMENT OF HIGHWAYS.

2. TRANSVERSE AND LONGITUDINAL SINGLE CRACK REPAIRING (STRUCTURAL CRACK)

THE TRANSVERSE AND LONGITUDINAL CRACKS ALONG THE THICKNESS OF CONCRETE SLAB CAN BE REPAIRED BY EPOXY COMPRESSING.

THE REPAIR CAN BEGIN WITH COMPRESSING EPOXY INTO SMALL POROUS TUBES LAID ALONG THE CRACKS. THE DISTANCE BETWEEN TUBES IS ABOUT 50–100 MM THE EPOXY COMPRESSED UNDER HIGH PRESSURE WILL SPREAD THROUGH THE CRACKS ALONG THE THICKNESS OF THE CONCRETE SLAB.

THE ENGINEER MAY USE OTHER APPROPRIATE WAYS OF USING EPOXY AS FOR A BETTER RESULT. THE AIMED RESULT IS THAT THE CRACKS ARE SO WELL SEALED THAT WATER CANNOT PASS THROUGH. THE TRANSVERSE AND LONGITUDINAL CRACKS ARE SHOWN IN FIGURE 2

3. SHALLOW JOINT SPALLING REPAIRING

SHALLOW SPALLING OF JOINT CAN BE REPAIRED BY USING EPOXY MORTAR AND FOLLOWING THESE STEPS:

3.1 CUT THE CONCRETE AROUND THE AREA OF SPALLING AND MAKE A SHAPE OF RECTANGLE (AS DEEP AS 25–30 MM)

3.2 SPREAD THE CUT WITH EPOXY MORTAR WHICH IS A APPROPRIATE COMBINATION OF COARSE SAND AND EPOXY. THE USE OF EPOXY FOR REPARING WORK SHOULD FOLLOW THE INSTRUCTIONS OF THE PRODUCER AND ALSO THE APPROVAL OF THE ENGINEER. SECTION OF SHALLOW SPALLING IS SHOWN IN FIGURE 3.

4. SHATTERED SLAB REPAIRING

TO REPAIR THE SHATTERED SLAB WITH MORE THAN TWO TRANSVERSE AND LONGITUDINAL CRACKS, THE CONCRETE SLAB NEEDS TO BE DISMANTLED AND THEN THE PIECES OF CONCRETE SLAB ARE TO BE REMOVED. THEN THE AREA WHERE THE SLAB WHERE REMOVED IS POURED NEW CONCRETE OVER. THE METHOD IS AS FOLLOW :

4.1 DISMANTLE THE SHATTERED SLABS BY USING A MACHINE AND REMOVE THEM.

4.2 EXAMINE AND MAKE SURE IF THE SUBBASE OR SAND CUSHION OR CRUSHED ROCK ARE IN GOOD CONDITION. COMPACTION SHOULD BE THE STANDARD OF THE DEPARTMENT OF HIGHWAYS. SOFT SPOT FOUND IN ANY AREA HAS TO BE REMOVED AND REPLACED BY SUITABLE MATERIALS SUCH AS CRUSHED ROCK OR SAND.

4.3 MAKE A HOLE AND PUT A NEW SET OF TIE BAR INTO IT. (REMOVE THE OLD SET)

4.4 THE NEW SET OF TIE BAR SHOULD BE PUT IN THE POSITION NEAR THE POSITION OF THE PREVIOUS SET.

4.5 POURING CONCRETE OVER THE PREPARED AREA. THE MATERIALS AND CONCRETE MIXING AS WELL AS CONSTRUCTION TECHNIQUES AND BROOMING SHALL BE IN ACCORDANCE WITH THE STANDARD DH–S 309/2544 REGARDING "REGULATIONS OF CONSTRUCTION CONTROL OF PORTLAND CEMENT CONCRETE PAVEMENT" REQUIRE NECESSARILY FOR CONCRETE MIXING AS:

- PORTLAND CEMENT 350 KG./M^3
- WATER/CEMENT RATIO 0.55 BY WEIGHT
- CONCRETE SLUMP 30–70 MM

CONCRETE SHALL HAVE A MINIMUM ULTIMATE COMPRESSIVE STRENGTH OF 32 MPa (325 KG/CM^2) FOR 150x150x150 MM. CUBE AT 28 DAYS

4.6 JOINTS SHALL BE CUT WITHIN THE SUITABLE TIME (APPROXIMATELY 4 – 12 HOURS AFTER CONCRETE POURING)

4.7 MASTIC JOINT SEALER SHALL BE DROPPED AS APPROVAL BY THE ENGINEER

NOTES:

1 . FOR THE CONCRETE SLAB WITH TRANSVERSE AND LONGITUDINAL SINGLE CRACKS, THE ELEVATION OF THE CONCRETE SLAB IN THE CRACK POSITION NEEDS TO BE CHECKED. IN CASE OF SETTLEMENT OR PAVEMENT STRUCTURES DAMAGE WHICH CAN CAUSE, CRACKS AND WHICH WILL NOT BE REPAIRED BY METHOD (2), THE METHOD (4) SHALL BE BROUGHT TO CONSIDERATION.

2. TRANSVERSE AND LONGITUDINAL SINGLE CRACKS ON CONCRETE SLABS, AFTER REPAIRING BY USING EPOXY, SHOULD BE CONSIDERED TO COMPRESS SLURRY CEMENT MORTAR INTO THE UNDERNEATH OF THE SLABS.

NOTES :

REINFORCED CONCRETE CULVERT PIPE INSTALLATION (MAX. FILL HEIGHT 9.00 M.)

A.) CONSTRUCTION METHODS WHEN FILL HEIGHT IS LESS THAN 1.20 M.

1. THE PROJECTION METHODS SHALL BE USED FOR PIPE INSTALLATION.
2. THE PIPE LINE LAYOUT SHALL BE SUITABLE FOR THE TERRAIN. THE EXISTING GROUND ALONG THE LINE OF CULVERT SHALL BE PREPARED TO THE SPECIFIED SLOPE.
3. PIPE BEDDING SHALL BE TYPE (a),(b) OR (c) AS SHOWN ON THE DRAWING AND SHALL DEPEND UPON PREVAILING SOIL CONDITION AND THE JUDGEMENT OF THE ENGINEER.
4. AFTER THE PIPE HAS BEEN PLACED, THE SUBGRADE AND/OR PORTION OF PAVEMENT SECTION WHICH ARE TO BE LAID ALONG BOTH SIDES OF THE LINE WITH IN A DISTANCE OF 4 PIPE DIAMETERS BUT NOT LESS THAN 5.00 M. FROM CENTERLINE OF THE PIPE SHALL BE CONSTRUCED LIGHT WEIGHT CONSTRUCTION EQUIPMENT USED FOR COMPACTION SHALL OPERATE IN A DIRECTION PERPENDICULAR TO CENTERLINE OF ROADWAY OR PARALLEL TO PIPE LINE UNTIL THE BACKFILL HAS REACHED AN ELEVATION OF AT LEAST 30 CM. ABOVE THE TOP OF PIPE.

B.) CONSTRUCTION METHODS WHEN FILL HEIGHT EXCEEDS 1.20 M.

1. PIPE INSTALLATION SHALL BE BY TRENCH METHOD. SUBGRADE SHALL BE FIRST CONSTRUCTED TO AN ELEVATION D/2 OR AT LEAST 60 CM. OVER TOP OF PROPOSED PIPE. A TRENCH SHALL THEN BE EXCAVATED ALONG THE PROPOSED LINE AS SHOWN ON THE DRAWING. TRENCH WALLS SHALL HAVE A SMOOTH SURFACE AND SHALL BE CONSTRUCTED VERTICALLY.
2. THE TRENCH BED SHALL BE PREPARED TO THE SPECIFIED SLOPE BEDDING TYPE SHALL BE (a),(b) OR (c) DEPEDING ON FOUNDATION SOIL AN AS DIRECTED BY THE ENGINEER.
3. PIPE SHALL BE INSTALLED ACCORDING TO SIZES SHOWN ON THE DRAWING. BACKFILLING OF PIPE CULVERTS SHALL NOT BE PERMITTED UNTIL AT LEAST 48 HOURS HAVE ELAPSED AFTER JOINT HAVE BEEN COMPLETED.
4. BACKFILL SHALL BE PLACED TO THE SUBGRADE ELEVATION AS DESCRIBED IN NOTE 1. BACKFILL SHALL BE A SELECT MATERIAL AND SHALL REQUIRE THE APPROVAL OF THE ENGINEER. METHOD OF COMPACTION OF BACKFILL SHALL BE THE SAME AS REQUIRED FOR SUBGRADE. COMPACTION EQUIPMENT SHALL BE APPROVED BY THE ENGINEER.

REINFORCED CONCRETE CULVERT PIPE INSTALLATION (FILL HEIGHT OVER 9.00 M.)

1. AFTER EXISTING GROUND HAS BEEN PREPARED TO SPECIFIED SLOPE AND ELEVATION. CONCRETE BEDDING FOR PIPE SUPPORT SHALL BE PLACED AS SHOWN IN SECTION Ⓐ
2. THE NUMBER OF PIPE BARRELS AND SIZE OF PIPE CULVERT SHALL BE INSTALLED AS SHOWN.
3. A CONCRETE CRADLE SHALL THEN BE PLACED AS SHOWN IN SECTION Ⓐ
4. EMBANKMENT SHALL BE CONSTRUCTED WITH SELECTED MATERIAL AND COMPACTED IN ACCORDANCE WITH THE TYPICAL CROSS-SECTION FOR THE ROUTE. EMBANKMENT SHALL BE COMPACTED TO THE Ⓐ – Ⓐ LEVEL, "d" METERS ABOVE THE TOP OF PIPE WITH LIGHT WEIGHT COMPACTION EQUIPMENT. CONSTRUCTION PROCEDURES SHALL REQUIRE SUPERVISION BY THE ENGINEER.
5. A TRENCH SHALL BE EXCAVATED TO A WIDTH "d" METERS WITH VERTICAL, SMOOTH WALL AND BACKFILL WITH LIGHT WEIGHT MATERIAL OF A TYPE SPECIFIED BY THE ENGINEER.
6. A) WHEN FILL HEIGHT IS LESS THAN 18.00 M. THE CONSTRUCTION HAS REACHED THE Ⓐ – Ⓐ LEVEL AS DESCRIBED IN NOTE 4 & 5 ABOVE , FULL EMBANKMENT SHALL THE BE PLACED TO MEET THE FINISHED SUBGRADE LEVEL.
   B) WHEN FILL HEIGHT EXCEEDS 18.00 M., EMBANKMENT CONSTRUCTION SHALL CONTINUE AS DESCRIBED IN NOTE 4 ABOVE UNTIL THE Ⓑ – Ⓑ LEVEL IS REACHED.
7. A TRENCH SHALL THEN BE EXCAVATED AS DESCRIBED IN NOTE 5 ABOVE EXCEPT BACKFILL SHALL BE REGULAR BACKFILL MATERIAL AND SHALL BE PLACED AS LOOSELY AS POSSIBLE WITHOUT COMPACTION.
8. THE REMAINING EMBANKMENT SHALL THEN BE CONSTRUCTED TO SUBGRADE LEVEL AND COMPACTED BY METHODS NORMALLY USED.
9. ALL DIMENSIONS ARE IN METERS UNLESS OTHERWISE INDICATED.

NOTES :

GENERAL

1. ALL DIMENSIONS ARE IN METERS UNLESS OTHERWISE INDICATED.
2. THE ENGINEER SHALL DECIDE WHETHER OR NOT TO PROVIDE SODDING FOR SLOPE PROTECTION. GENERALLY EMBANKMENTS COMPOSED OF SANDY OR SILTY MATERIALS WILL REQUIRE SODDING. CUT SLOPE WILL NOT NORMALLY BE SODDED AND THEN ONLY AT THE DIRECTION OF THE ENGINEER.
3. WHERE THE SIDE SLOPE MATERIAL IS NOT SUITABLE FOR GROWING GRASS,ORGANIC TOP SOIL APPROXIMATELY 0.10 M THICK SHALL BE PLACED ON THE SIDE SLOPES AND LIGHTLY COMPACTED TO THE SATISFACTION OF THE ENGINEER, THOROUGHLY MOISTENED WITH WATER AND SODDING PLACED.
4. WHERE THE SIDE SLOPE MATERIAL IS SUITABLE FOR GRASS, THE FOLLOWING PROCEDURES SHALL APPLY AFTER THE ROADWAY FORMATION IS CONSTRUCTED TO THE ELEVATION AS SHOWN ON THE DRAWING AND THE SIDE SLOPE HAS BEEN SHAPED AS REQUIRED. THE SIDE SLOPE MATERIAL SHALL BE SCARIFIED TO A MINIMUM DEPTH OF 0.05 M. THOROUGHLY MOISTENED WITH WATER AND SODDING PLACED.
5. THE TYPE OF GRASS USED SHALL BE A LOCAL SPECIES WHICH GROWS RAPIDLY. THE ENGINEER SHALL DECIDE IN THE FIELD WHETHER TOP SOIL IS REQUIRED AND WHICH TYPE OF GRASS SHALL BE USED. THE WORK SHALL BE COMPLETED TO THE DETAILS AS SPECIFIED ON THE DRAWING.
6. THE CONTRACTOR SHALL BE RESPONSIBLE FOR MAINTAINING THE GRASS UNTIL THE END OF THE MAINTENANCE PERIOD.

BLOCK SODDING

7. BLOCK SODDING OBTAINED FROM PLANTED GROUND FOR PLACING SHALL HAVE THEIR ROOT SYSTEM PACKED WITH MOIST EARTH AT LEAST 0.04 M THICK AND HAVE A MINIMUM SIZE OF APPROXIMATELY 0.30 x 0.30 M. THE SODDING SHALL BE PLACED ON THE SIDE SLOPES WITHIN 48 HOURS AFTER REMOVAL FROM BORROW AREA.
8. SODDING SHALL BE LAID IN STAGGERED ROWS PARALLEL TO ROADWAY ALIGNMENT AS SHOWN ON THE DRAWING. EACH BLOCK SHALL BE STAGGERED ONE HALF ITS LENGTH AND BE FIRMLY BUTTED AGAINST THE PREVIOUS BLOCK(S).
9. THE LENGTH " L" SHALL BE DIRECTED BY THE ENGINEER WHICH ABOVE EXISTING GROUND APPROXIMATELY 0.30 M OR NO EROSIVE POSITION.
10. PLANTED BLOCK SHALL BE PLACED AND LIGHTLY COMPACTED ON THE DESIGNATED AREAS AND THE LONGITUDINAL INTERSTICES SEALED WITH TOP SOIL. THE PLANTED SODS SHALL BE WATERED DAILY UNTIL THEY HAVE ROOTED AND HAVE ESTABLISHED THEMSELVES IN THE NEW AREAS.

STRIP SODDING

11. STRIP SODDING SHALL ALSO HAVE THEIR ROOT SYSTEMS PACKED WITH MOIST EARTH AT LEAST 0.04 M THICK AND HAVE A MINIMUM WIDTH OF 0.20 M. STRIP SODDING SHALL ALSO BE PLACED WITHIN 48 HOURS AFTER REMOVAL FROM BORROW AREAS.
12. SODDING SHALL BE PLACED IN CONTINUOUS ROW PARALLEL TO ROADWAY ALIGNMENT AS SHOWN ON THE DRAWINGS. EACH ROW SHALL BE AT LEAST 0.20 M WIDE AND GAPS BETWEEN ROWS SHALL NOT EXCEED 0.20 M.
13. THE LENGTH "L" SHALL BE DIRECTED BY THE ENGINEER WHICH ABOVE EXISTING GROUND APPROXIMATELY 0.30 M OR NO EROSIVE POSITION.
14. PLANTED STRIPS SHALL BE PLACED AND LIGHTLY COMPACTED ON THE DESIGNATED AREA AND THE TRANSVERSE INTERSTICES SEALED WITH TOP SOIL. STRIP SODDING SHALL BE MAINTAINED AS DESCRIBED IN NOTE NO. 3 AND NO.6 ABOVE.

1.2 IF THE SURFACE OF BACK SLOPE IS TOO HARD, SHAPE IT BY STRIPPING SOME EXISTING SOIL THAT IS COVERING THE SURFACE. THE SHAPING WILL MAKE THE SURFACE SOFT AND SHOULD LEAVE THE 2.5 CM. THICKNESS OF THE SURFACE. THERE SHOULD BE GROOVED WHICH ARE 5–7 CM. APART ALONG THE LENGTH OF AREA.

1.3 SHAPING THE SURFACE OF THE SIDE SLOPE IS DONE THE SAME WAY AS IN ITEM 1.2 AND YET AS DIRECTED BY THE ENGINEER.

1.4 IN SOME AREAS THAT ARE COVERED WITH BOULDERS, SOFT ROCK OR ROCKS WITH SEEPAGE FLOW OR HAVE RILLS OR GULLIES, THE SOIL SHAPING SHOULD BE DIRECTED BY THE ENGINEER.

2. SUGGESTED GRASS AND QUANTITIES OF ITS SEEDS

2.1 IN GENERAL, THE SUGGESTED GRASS IS THAT OF LOCAL KINDS OR ANY KINDS THAT HAVE BEEN WELL GROWN IN THAILAND. THE GRASS USED AS PERMANENT GRASS FOR PREVENTION SOIL EROSION SHOULD BE PERENNIAL GRASS AND HAS STRONG ROOTS SYSTEM THAT CAN FIRMLY HOLD TO THE GROUND AND CAN BEAR ANY BAD STATE OF SOIL. WHILE IN USE, THE GRASS SHOULD BE MIXED WITH BEAN PLANTS WHICH WILL BE A NITROGEN CATCHER OR MIXED WITH SHORT–LIFE GRASS WHICH WILL BE SCARIFY GRASS, AS DIRECTED BY THE ENGINEER.

2.2 SUGGESTED GRASS AND QUALITY OF ITS SEEDS
ANY OTHER KINDS THAT HAVE THE SAME QUALITIES AS MENTIONED IN ITEM 2.1 CAN ALSO BE USED, YET AS DIRECTED BY THE ENGINEER AND APPROVAL BY THE LOCATION AND DESIGN DIVISION D.O.H.

5. PERIOD OF TIME :
HYDROSEEDING SHOULD BE DONE 2–4 WEEKS BEFORE RAINY SEASON.

6. FERTILIZING :
10–15 GM/M2 OF UREA FERTILIZER SHOULD BE SPRAYED ON THE AREA ONE MONTH AFTER HYDROSEEDING.

7. 2–3 MONTHS AFTER HYDROSEEDING, 75% OF GRASS SHOULD GROW AND COVER THE GROUND EXCEPT HARD SOIL OR ROCK OR BOULDERS.

8. INVESTIGATION : IF THERE ARE STILL SOME AREAS THAT ARE NOT SUCCESSFULLY DONE ACCORDING TO ITEM 7, THE CONTRACTOR NEEDS TO REDO THE HYDROSEEDING.

MATERIAL SPECIFICATIONS FOR REINFORCED SOIL SLOPE USING GEOGRID

1. GEOGRID REINFORCEMENT MATERIAL

1.1 THE SPECIFIC GEOGRID REINFORCEMENT MATERIAL AND SUPPLIER SHALL BE PREAPPROVED BY THE AGENCY AS OUTLINED IN THE AGENCY'S REINFORCED SLOPE POLICY.

1.2 THE GEOGRID REINFORCEMENT SHALL BE A REGULAR NETWORK OF INTEGRALLY CONNECTED POLYMER TENSILE ELEMENTS WITH APERTURE GEOMETRY SUFFICIENT TO PERMIT SIGNIFICANT MECHANICAL INTERLOCK WITH THE SURROUNDING SOIL OR ROCK. THE GEOGRID REINFORCEMENT STRUCTURE SHALL BE DIMENSIONALLY STABLE AND ABLE TO RETAIN ITS GEOMETRY UNDER CONSTRUCTION STRESSES AND SHALL HAVE HIGH RESISTANCE TO DAMAGE DURING CONSTRUCTION, TO ULTRAVIOLET DEGRADATION, AND TO ALL FORMS OF CHEMICAL AND BIOLOGICAL DEGRADATION ENCOUNTERED IN THE SOIL BEING REINFORCED.

1.3 GEOGRID SHALL MADE FROM HIGH MOLECULAR WEIGHT, HIGH TENACITY POLYESTER MULTIFILAMENT YARNS. THE YARNS ARE WOVEN ON TENSION IN MACHINE DIRECTION AND FINISHED WITH A POLYMERIC COATING.

1.4 THE GEOGRID SHALL HAVE PHYSICAL AND ENGINEERING PROPERTIES AS LISTED IN TABLE 1

1.5 CERTIFICATION: THE CONTRACTOR SHALL SUBMIT A MANUFACTURER'S CERTIFICATION THAT THE GEOGRID SUPPLIED MEET THE RESPECTIVE INDEX CRITERIA SET WHEN GEOSYNTHETIC WAS APPROVED BY THE AGENCY, MEASURED IN FULL ACCORDANCE WITH ALL TEST METHODS AND STANDARDS SPECIFIED. IN CASE OF DISPUTE OVER VALIDITY OF VALUES, THE ENGINEER CAN REQUIRE THE CONTRACTOR TO SUPPLY TEST DATA FROM AGENCY–APPROVED LABORATORY TO SUPPORT THE CERTIFIED VALUES SUBMITTED.

1.6 GEOGRID REDUCTION FACTOR (RF) FOR CALCULATION OF LONG TERM DESIGN STRENGTH ACCORDING TO FHWA NHI–00–043 OR BS 8006 SHALL NOT BE MORE THAN OR EQUAL TO THE VALUES AS BELOW;

1.6.1 REDUCTION FACTOR FOR CREEP : 1.50

1.6.2 REDUCTION FACTOR FOR INSTALLATION DAMAGE: 1.12 FOR FINE MATERIAL AND 1.25 FOR COARSE MATERIAL

1.6.3 REDUCTION FACTOR FOR DURABILITY (ENVIRONMENTAL EFFECT) : 1.15

THE CREEP TEST MUST BE PERFORMED ON AT LEAST ONE (1) TYPE OF GEOGRID TO REPRESENT THE OVERALL CREEP PROPERTY FOR EACH GEOGRID MANUFACTURER. NO NEED TO SUBMIT CREEP TEST REPORT FOR EVERY TYPE OF GEOGRID USED.

2. CONSTRUCTION

2.1 DELIVERY, STORAGE, AND HANDLING: FOLLOW REQUIREMENTS SET UNDER MATERIAL SPECIFICATIONS FOR GEOGRID REINFORCEMENT.

2.2 ON–SITE REPRESENTATIVE: GEOGRID REINFORCEMENT MATERIAL SUPPLIERS SHALL PROVIDE A QUALIFIED AND EXPERIENCED REPRESENTATIVE ON SITE, FOR A MINIMUM OF THREE DAYS, TO ASSIST THE CONTRACTOR AND AGENCY INSPECTORS AT THE START OF CONSTRUCTION. IF THERE IS MORE THAN ONE SLOPE ON A PROJECT, THEN THIS CRITERIA WILL APPLY TO CONSTRUCTION OF THE INITIAL SLOPE ONLY. THE REPRESENTATIVE SHALL ALSO BE AVAILABLE ON AN AS–NEEDED BASIS, AS REQUESTED BY THE AGENCY ENGINEER, DURING CONSTRUCTION OF THE REMAINING SLOPE(S).

2.3 SITE EXCAVATION: ALL AREAS IMMEDIATELY BENEATH THE INSTALLATION AREA FOR THE GEOGRID REINFORCEMENT SHALL BE PROPERLY PREPARED AS DETAILED ON THE PLANS, SPECIFIED ELSEWHERE WITHIN THE SPECIFICATIONS, OR DIRECTED BY THE ENGINEER. SUBGRADE SURFACE SHALL BE LEVEL, FREE FROM DELETERIOUS MATERIALS, LOOSE, OR OTHERWISE UNSUITABLE SOILS. PRIOR TO PLACEMENT OF GEOGRID REINFORCEMENT, SUBGRADE SHALL BE PROOFROLLED TO PROVIDE A UNIFORM AND FIRM SURFACE. ANY SOFT AREAS, AS DETERMINED BY THE OWNER'S ENGINEER, SHALL BE EXCAVATED AND REPLACED WITH SUITABLE COMPACTED SOILS. FOUNDATION SURFACE SHALL BE INSPECTED AND APPROVED BY THE OWNER'S GEOTECHNICAL ENGINEER PRIOR TO FILL PLACEMENT. BENCHING THE BACKCUT INTO COMPETENT SOIL IS RECOMMENDED TO IMPROVE STABILITY.

2.4 GEOGRID PLACEMENT: THE GEOGRID REINFORCEMENT SHALL BE INSTALLED IN ACCORDANCE WITH THE MANUFACTURER'S RECOMMENDATIONS. THE GEOGRID REINFORCEMENT SHALL BE PLACED WITHIN THE LAYERS OF COMPACTED SOIL AS SHOWN ON PLANS OR AS DIRECTED.

THE GEOGRID REINFORCEMENT SHALL BE PLACED IN CONTINUOUS, LONGITUDINAL STRIPS IN THE DIRECTION OF MAIN REINFORCEMENT. HOWEVER, IF THE CONTRACTOR IS UNABLE TO COMPLETE A REQUIRED LENGTH WITH A SINGLE CONTINUOUS LENGTH OF GEOGRID, A JOINT MAY BE MADE WITH THE ENGINEER'S APPROVAL. ONLY ONE JOINT PER LENGTH OF GEOGRID SHALL BE ALLOWED. THIS JOINT SHALL BE MADE FOR THE FULL WIDTH OF THE STRIP BY USING A SIMILAR MATERIAL WITH SIMILAR STRENGTH. JOINTS IN GEOGRID REINFORCEMENT SHALL BE PULLED AND HELD TAUT DURING FILL PLACEMENT. JOINTS SHALL NOT BE USED WITH GEOTEXTILES.

ADJACENT STRIPS, IN THE CASE OF 100% COVERAGE IN PLAN VIEW, NEED NOT BE OVERLAPPED. THE MINIMUM HORIZONTAL COVERAGE IS 50%, WITH HORIZONTAL SPACINGS BETWEEN REINFORCEMENT NO GREATER THAN 1.00 M. HORIZONTAL COVERAGE OF LESS THAN 100% SHALL NOT BE ALLOWED UNLESS SPECIFICALLY DETAILED IN THE CONSTRUCTION DRAWINGS. ADJACENT ROLLS OF GEOGRID REINFORCEMENT SHALL BE OVERLAPPED OR MECHANICALLY CONNECTED WHERE EXPOSED IN A WRAP–AROUND FACE SYSTEM, AS APPLICABLE.

PLACE ONLY THAT AMOUNT OF GEOGRID REINFORCEMENT REQUIRED FOR IMMEDIATELY PENDING WORK TO PREVENT UNDUE DAMAGE. AFTER A LAYER OF GEOGRID REINFORCEMENT HAS BEEN PLACED, THE NEXT SUCCEEDING LAYER OF SOIL SHALL BE PLACED AND COMPACTED AS APPROPRIATE. AFTER THE SPECIFIED SOIL LAYER HAS BEEN PLACED, THE NEXT GEOGRID REINFORCEMENT LAYER SHALL BE INSTALLED. THE PROCESS SHALL BE REPEATED FOR EACH SUBSEQUENT LAYER OF GEOGRID REINFORCEMENT AND SOIL.

GEOGRID REINFORCEMENT SHALL BE PLACED TO LAY FLAT AND PULLED TIGHT PRIOR TO BACKFILLING. AFTER A LAYER OF GEOGRID REINFORCEMENT HAS BEEN PLACED, SUITABLE MEANS, SUCH AS PINS OR SMALL PILES OF SOIL, SHALL BE USED TO HOLD THE GEOGRID REINFORCEMENT IN POSITION UNTIL THE SUBSEQUENT SOIL LAYER CAN BE PLACED. UNDER NO CIRCUMSTANCES SHALL A TRACK–TYPE VEHICLE BE ALLOWED ON THE GEOGRID REINFORCEMENT BEFORE AT LEAST 150 MM OF SOIL HAS BEEN PLACED.

DURING CONSTRUCTION, THE SURFACE OF THE FILL SHOULD BE KEPT APPROXIMATELY HORIZONTAL. GEOGRID REINFORCEMENT SHALL BE PLACED DIRECTLY ON THE COMPACTED HORIZONTAL FILL SURFACE. GEOGRID REINFORCEMENTS ARE TO BE PLACED WITHIN 0.075 M OF THE DESIGN ELEVATIONS AND EXTEND THE LENGTH AS SHOWN ON THE ELEVATION VIEW, UNLESS OTHERWISE DIRECTED BY OWNER'S ENGINEER. CORRECT ORIENTATION OF THE GEOGRID REINFORCEMENT SHALL BE VERIFIED BY THE CONTRACTOR.

2.5 FILL PLACEMENT: FILL SHALL BE COMPACTED AS SPECIFIED BY PROJECT SPECIFICATIONS OR TO AT LEAST 95 PERCENT OF THE MAXIMUM DENSITY DETERMINED IN ACCORDANCE WITH AASHTO T–99, WHICHEVER IS GREATER. DENSITY TESTING SHALL BE MADE EVERY 1,000 CUBIC METERS OF SOIL PLACEMENT OR AS OTHERWISE SPECIFIED BY OWNER'S ENGINEER OR CONTACT DOCUMENTS.
BACKFILL SHALL BE PLACED, SPREAD, AND COMPACTED IN SUCH A MANNER TO MINIMIZE THE DEVELOPMENT OF WRINKLES AND/OR DISPLACEMENT OF THE GEOGRID REINFORCEMENT.
FILL SHALL BE PLACED IN 0.30 M MAXIMUM LIFT THICKNESS WHERE HEAVY COMPACTION EQUIPMENT IS TO BE USED, AND 0.150 M MAXIMUM UNCOMPACTED LIFT THICKNESS WHERE HAND OPERATED EQUIPMENT IS USED.
BACKFILL SHALL BE GRADED AWAY FROM THE SLOPE CREST AND ROLLED AT THE END OF EACH WORKDAY TO PREVENT PONDING OF WATER ON THE SURFACE OF THE REINFORCE SOIL MASS.
TRACKED CONSTRUCTION EQUIPMENT SHALL NOT BE OPERATED DIRECTLY UPON THE GEOGRID REINFORCEMENT. A MINIMUM FILL THICKNESS OF 150 MM IS REQUIRED PRIOR TO OPERATION OF TRACKED VEHICLES OVER THE GEOGRID REINFORCEMENT. TURNING IF TRACKED VEHICLES SHOULD BE KEPT TO MINIMUM TO PREVENT TRACKS FROM DISPLACING THE FILL AND GEOGRID REINFORCEMENT.
IF RECOMMENDED BY THE GEOGRID MANUFACTURER AND APPROVED BY ENGINEER, RUBBER–TIRED EQUIPMENT MAY PASS OVER THE GEOGRID REINFORCEMENT AT SLOW SPEEDS, LESS THAN 15 KM/HOUR. SUDDEN BRAKING AND SHARP TURNING SHALL BE AVOIDED.

2.6 FINAL SLOPE GEOMETRY VERIFICATION: CONTRACTOR SHALL CONFIRM THAT AS–BUILT SLOPE GEOMETRIES CONFORM TO APPROXIMATE GEOMETRIES SHOWN ON CONSTRUCTION DRAWINGS.

3. METHOD OF MEASUREMENT

MEASUREMENT OF GEOGRID REINFORCEMENT IS ON A SQUARE–METER BASIS AND IS COMPUTED ON THE TOTAL AREA OF GEOGRID REINFORCEMENT SHOWN ON THE CONSTRUCTION DRAWINGS, EXCLUSIVE OF THE AREA OF GEOGRID USED IN ANY OVERLAPS. OVERLAPS ARE AN INCIDENTAL ITEM.

4. BASE OF PAYMENT

THE ACCEPTED QUANTITIES OF GEOGRID REINFORCEMENT BY TYPE WILL BE PAID FOR PER SQUARE–METER IN PLACE.

2) MSE WALL SYSTEMS ARE FLEXIBLE AND CAN ACCOMMODATE MODERATE SETTLEMENTS WITHOUT DISTRESS.
3) SOIL REINFORCEMENT IS LIGHT AND EASY TO HANDLE.

(8) STEEL – IN ACCORDANCE WITH SECTION 9 OF AASHTO, 2002, DIVISION II.
(9) COMPRESSIVE STRENGTH – ACCEPTANCE OF CONCRETE PANELS WITH RESPECT TO COMPRESSIVE STRENGTH WILL BE DETERMINED ON THE BASIS OF PRODUCTION LOTS.

A PRODUCTION LOT IS DEFINED AS A GROUP OF PANELS THAT WILL BE REPRESENTED BY A SINGLE COMPRESSIVE STRENGTH SAMPLE AND WILL CONSIST OF EITHER 40 PANELS OR A SINGLE DAY'S PRODUCTION, WHICHEVER IS LESS.

DURING THE PRODUCTION OF THE CONCRETE PANELS, THE MANUFACTURER WILL RANDOMLY SAMPLE THE CONCRETE IN ACCORDANCE WITH AASHTO T–141. A SINGLE COMPRESSIVE STRENGTH SAMPLE, CONSISTING OF A MINIMUM OF FOUR CYLINDERS, WILL BE RANDOMLY SELECTED FOR EVERY PRODUCTION LOT.

FOR EVERY COMPRESSIVE STRENGTH SAMPLE, A MINIMUM OF TWO CYLINDERS SHALL BE CURED IN ACCORDANCE WITH AASHTO T–23 AND TESTED AT 28 DAYS. THE AVERAGE COMPRESSIVE STRENGTH OF THESE CYLINDERS, WHEN TESTED IN ACCORDANCE WITH AASHTO T–22, WILL PROVIDE A COMPRESSIVE STRENGTH TEST RESULT THAT WILL DETERMINE THE COMPRESSIVE STRENGTH OF THE PRODUCTION LOT.

IF THE CONTRACTOR WISHES TO REMOVE FORMS OR SHIP THE PANELS PRIOR TO 28 DAYS, A MINIMUM OF TWO ADDITIONAL CYLINDERS WILL BE CURED IN THE SAME MANNER AS THE PANELS. THE AVERAGE COMPRESSIVE STRENGTH OF THESE CYLINDERS WHEN TESTED IN ACCORDANCE WITH AASHTO T–22 WILL DETERMINE WHETHER THE FORMS CAN BE REMOVED OR THE PANELS SHIPPED. ACCEPTANCE OF A PRODUCTION LOT WILL BE MADE IF THE COMPRESSIVE STRENGTH TEST RESULT IS GREATER THAN OR EQUAL TO 27.6 MPA. IF THE COMPRESSIVE STRENGTH TEST RESULT IS LESS THAN 28 MPA (280 KSC), THEN ACCEPTANCE OF THE PRODUCTION LOT WILL BE BASED ON ITS MEETING THE FOLLOWING ACCEPTANCE CRITERIA IN THEIR ENTIRETY:

– NINETY PERCENT OF THE COMPRESSIVE STRENGTH TEST RESULTS FOR THE OVERALL PRODUCTION SHALL EXCEED 29 MPA (290 KSC)
– THE AVERAGE OF ANY SIX CONSECUTIVE COMPRESSIVE STRENGTH TEST RESULTS SHALL EXCEED 30 MPA (300 KSC)

DESIGN AND SPECIAL PROVISION FOR GABION WALL

1. GENERAL DESCRIPTIONS

GABIONS ARE LARGE CAGES OR BASKETS USUALLY OF STEEL WIRE MESH, RECTANGULAR IN SHAPE, FILLED WITH STONE AND USE TO BUILD RETAINING WALLS, REVETMENTS AND ANTI-EROSION WORKS. A FILTER LAYER, TODAY OFTEN A GEOTEXTILE, IS PLACED BETWEEN THE GABIONS AND THE BACKFILL IF THERE IS A DANGER OF SOIL PARTICLES BEING WASHED OUT THROUGH THE ROCK FILL BY SEEPAGE OR WAVE ACTION.

2. ADVANTAGES OF GABION WALL

GABION WALL MAY PROVIDE THE FOLLOWING ADVANTAGES FOR PROJECTS:

2.1 FLEXIBILITY: GABIONS CONFORM TO DIFFICULT SITE GEOMETRY AND CAN ADJUST TO DIFFERENTIAL SETTLEMENT AND LATERAL MOVEMENT.

2.2 PERMEABILITY: PREVENTS THE BUILD UP OF WATER PRESSURE. ALLOWS THE CONSTRUCTION OF HIGH-CAPACITY DRAINAGE SYSTEMS.

2.3 LOW LEVEL OF WORK SKILL REQUIRED: TRAINING OF UNSKILLED LABOR IS POSSIBLE WITHIN A SHORT TIME.

2.4 LOW COST: MINIMAL TRANSPORTATION COST WHERE LOCAL ROCK FILL CAN BE USED. SPEEDY CONSTRUCTION.

3. MATERIALS

3.1 HEXAGONAL WOVEN WIRE MESH

THE NETTING IS MECHANICALLY WOVEN IN A CONTINUOUS SHEET, TO FORM A HEXAGONAL MESH WHICH CAN STRETCH OR CONTRACT IN TWO DIRECTIONS IN ITS OWN PLANE SO THAT A RECTANGULAR WIRE MESH BOX FILLED WITH QUARRIED STONE OR RIVER SHINGLE CAN DEFORM IN ANY DIRECTION.

4. CORROSION AND DAMAGE OF GABIONS

IN THE USE OF GABIONS THE FOLLOWING MATTERS SHOULD BE CONSIDERED.

4.1 GALVANIZED WIRE. HEXAGONAL WOVEN MESH GABIONS SHOULD BE MADE FROM WIRE GALVANIZED TO BS 443 STANDARD. GALVANIZED GABIONS MAY BE USED WHERE THE EXPECTED LIFE TO THE GALVANIZED WIRE IS SUFFICIENT FOR THE INTENDED LIFE OF THE STRUCTURE. GENERALLY, GALVANIZED WIRE IS USED FOR NORMAL ENVIRONMENT WHERE THE EFFECT OF WATER OR ACID SOIL IS NOT MUCH. IF THE CONDITIONS ARE AGGRESSIVE TO THE GALVANIZED WIRE COATING, THE USE OF GALFAN COATED WIRE (ALU-ZINC) OR POLYVINYL CHLORIDE (PVC) COATED WIRE SHOULD BE CONSIDERED.

4.2 GALFAN COATED WIRE. THE GALFAN COATING HAS MORE CORROSION RESISTANCE THAN NORMAL GALVANIZED COATED OF AROUND 3 – 5 TIMES. THIS COATING COMPOSITE CONSISTS OF ALUMINIUM (5%) AND ZINC (95%) AND SHALL HAVE SPECIFICATION ACCORDING TO ASTM A856/A 856M-98. GALFAN COATED WIRE WILL BE USED FOR SEVERE CONDITION SUCH AS RIVERBANK OR WHERE THE EXTRA LIFETIME OF COATING IS REQUIRED.

4.3 PVC COATED WIRE. THE PVC COATING SHOULD CONFORM TO BS 4102. THE RADIAL THICKNESS OF THE COATING APPLIED TO THE GALVANIZED WIRE CORE SHOULD BE A MINIMUM OF 0.25 MM. THE PVC SHOULD BE SUFFICIENTLY BONDED TO THE GALVANIZED WIRE CORE TO PREVENT A CAPILLARY FLOW OF WATER BETWEEN THE WIRE AND THE PVC COATING LEADING TO CORROSION. THE CONDITION SUITED FOR PVC COATED GABION IS SEVERE CONDITION SUCH AS RIVERBANK AND WHERE HIGH CORROSION SOIL (ACID SOIL) OR WATER IS FOUND.

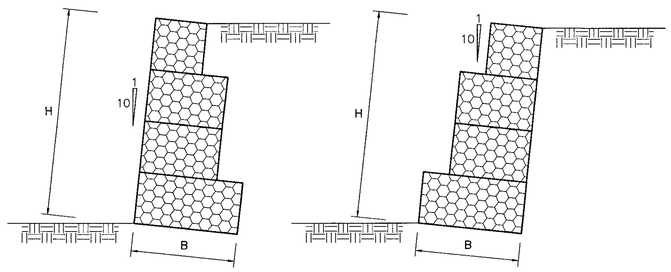

4.4 DAMAGE BY ABRASION. GALVANIZED, GALFAN AND PVC COATED WIRE MAY BE DAMAGED BY ABRASION, BY MOVING SHINGLE IN RIVER BEDS AND ON COASTAL FORESHORES. IN MOUNTAIN RIVERS, WHERE THE HEAVY WATERBORNE MATERIAL USUALLY TRAVELS ALONG THE BED, GALFAN AND PVC GABION MESH HAS BEEN SATISFACTORY IN THE CONSTRUCTION OF RIVER WALLS WITH VERTICAL WATER FACES BUT ANTI-SCOUR APRONS WITH HORIZONTAL SURFACES SHOULD BE AVOIDED. GALVANIZED MESH IS MORE EASILY ABRADED IN THESE SITUATIONS.

4.5 ON COASTAL FORESHORES, PVC COATED GABIONS ARE UNSATISFACTORY WHERE LARGE SHINGLE, OR HEAVY ABRASIVE MATERIAL, IS LIKELY TO BE THROWN AGAINST, OR, WASHED OVER THE STRUCTURE BY WAVE ACTION. HOWEVER, IN THIS EXTREME CONDITION THE PVC-GALFAN COATED GABION IS MORE FAVOURED.

5. DESIGN CONSIDERATIONS

5.1 WALL GEOMETRY

TYPICAL CROSS SECTION OF GABION WALLS ARE SHOWN IN FIGURE 1 DEPENDING ON THE PROPERTIES AND THE SLOPE OF THE BACKFILL, THE BASE OF A GABION WALL MAY RANGE FROM 50 TO 90% OF ITS HEIGHT. IT IS COMMON PRACTICE TO TILT THE WALL BACKWARD AT AN ANGLE OF ABOUT 6° (1:10) TO INCREASE WALL STABILITY. HIGH WALLS MAY REQUIRE A CONCRETE FOOTING, BUT IN GENERAL ONLY LITTLE FOUNDATION PREPARATION NEEDS TO BE DONE. THE CHOICE OF EITHER BATTERED OR STEPPED FACES RESTS WITH DESIGNER; STEPPED FACE RECOMMENDED IF WALL IS MORE THAN 3.00 M HIGH.

(A) BATTERED FACE (B) STEPPED FACE

FIGURE 1 TYPICAL CROSS SECTION OF GABION WALL

5.2 UNIT WEIGHT OF ROCK-FILLED GABIONS

THE UNIT WEIGHT OF ROCK-FILLED GABIONS IS ABOUT TWO-THIRDS OF THE UNIT WEIGHT OF THE ROCK SOLIDS. THIS MEANS THAT THE USE OF TYPICAL HARD LIMESTONE OR GRANITE RESULTS IN A FILL WEIGHT OF ABOUT 17 KN/CU.M. OTHER TYPICAL VALUE OF ROCK AS SHOWN IN TABLE 1.

5.3 DESIGN PARAMETERS

SEE TABLE 2

5.4 DESIGN

5.4.1 GENERAL

GABION WALLS SHOULD BE DESIGNED ON THE SAME PRINCIPLE AS A GRAVITY MASS WALL, NO ALLOWANCE BEING MADE FOR THE STRENGTH OR MASS OF THE WIRE MESH.

TABLE 1 TYPICAL UNIT WEIGHT OF ROCK-FILLED IN GABION BASKET

TYPE OF ROCK	UNIT WEIGHT (KN/CU.M)
BASALT	29
GRANITE	26
HARD LIMESTONE	26
TRACHYTES	25
SANDSTONE	23
SOFT LIMESTONE	22

TABLE 2 SUMMARY OF DESIGN PARAMETERS

MATERIALS	UNIT WEIGHT (KN/CU.M)	ANGLE OF INTERNAL FRICTION (DEG)	COHESION (KPA)
SELECTED BACKFILL	20.00	32.00	0.00
FOUNDATION	20.00	30.00	0.00
ROCK-FILLED	25.00	–	–

5.4.2 EQUILIBRIUM OF THE WALL

THE RETAINED SOIL WILL EXERT ACTIVE PRESSURE OVER THE ENTIRE WALL HEIGHT, BUT WITH NO HYDROSTATIC PRESSURE.

THE CROSS SECTION OF A GABION WALL, AS A MASS GRAVITY STRUCTURE, SHOULD BE PROPORTIONED SO THAT THE RESULTANT FORCE AT ANY HORIZONTAL SECTION LIES WITHIN THE MIDDLE THIRD OF THAT SECTION. THE THRUST EXERTED BY THE BACKFILL ON A GABION WALL ACTS AT THE PERPENDICULAR TO THE WALL. THIS ANGLE CAN BE ASSUMED TO EQUAL THE DESIGN VALUE OF EFFECTIVE ANGLE OF SHEARING RESISTANCE DUE TO THE ROUGHNESS OF THE GABION SURFACE, WHICH MAY BE ASSUMED TO BE A SOIL TO SOIL FRICTION SURFACE.

WHEN RETAINED SOIL IS SUPPORT BY A HEEL TO THE WALL THE SOIL MAY BE ASSUMED TO BE A PART OF THE WALL AND THE DESIGN ASSUMES A VIRTUAL VERTICAL REAR FACE.

WHEN CALCULATING THE RESISTANCE AGAINST SLIDING FORWARD THE ANGLE OF FRICTION SHOULD BE TAKEN AS THAT OF THE FOUNDATION SOIL AND NOT AS THAT BETWEEN STONE RUBBLE AND THE SOIL. THE ANGLE OF FRICTION BETWEEN THE BASE OF GABION WALL AND GRANULAR SOIL MAY BE ASSUME 0.9 TIMES THE ANGLE OF INTERNAL FRICTION OF SOIL. THE GABION WALL CAN BE BUILT ON A SLOPED FOUNDATION TO INCREASE THIS RESISTANCE.

WHEN CALCULATING THE MAXIMUM PRESSURE AT THE BASE OF GABION WALL MUST BE LESS THAN THE ANTICIPATED BEARING CAPACITY OF THE SOIL UNDER THE WALL.

5.4.3 DESIGN ASSUMPTIONS

5.4.3.1 STEPPED FACE WALL WITH HORIZONTAL BACKFILL

5.4.3.2 BACKFILL MATERIAL BEHIND GABION WALL IS COHESIONLESS SOIL

5.4.3.3 NO GROUNDWATER ACTING BEHIND THE WALL (FREE DRAINAGE) IN THE CASE OF GABION WALL LOCATED IN THE ARID REGION OF SIDE SLOPE.

5.4.3.4 ASSUME DRAWDOWN CONDITION FROM UPPERMOST TO THE HEEL OF GABION WALL IN THE CASE OF GABION WALL LOCATED IN THE SIDE SLOPE AND ADJACENT WITH WATERFRONT REGION.

5.4.3.5 SUPERIMPOSED LOAD OVER THE BACKFILL MATERIAL 15 KPA

5.4.3.6 NO CONSIDERED EARTHQUAKE LOADING IN THE DESIGN SITUATION

5.4.3.7 ASSUME THE WALL TILT AWAY FROM THE SOIL RETAINED. WITH SUFFICIENT WALL TILT, A TRIANGULAR SOIL WEDGE BEHIND THE WALL WITH FAIL. THE LATERAL PRESSURE FOR THIS CONDITION IS REFERRED TO AS ACTIVE EARTH PRESSURE (KA)

5.5 CALCULATIONS

5.5.1 ACTIVE EARTH PRESSURE, KA

5.5.2 STABILITY AGAINST SLIDING (FS-SLIDING)

5.5.3 STABILITY AGAINST OVERTURNING (FS-OVERTURNING)

5.5.4 BEARING CAPACITY OF FOUNDATION (Q-ALLOWABLE)

5.5.5 OVERALL STABILITY (FS-OVERALL)

5.6 MINIMUM FACTOR OF SAFETY

5.6.1 STABILITY AGAINST SLIDING SHALL NOT BE LESS THAN 1.50.

5.6.2 STABILITY AGAINST OVERTURNING SHALL NOT BE LESS THAN 1.50.

5.6.3 BEARING CAPACITY OF FOUNDATION SHALL NOT BE LESS THAN 3.00.

5.6.4 OVERALL STABILITY SHALL NOT BE LESS THAN 1.30.

6. CONSTRUCTIONS

6.1 POSITIONING CAGES

EMPTY CAGE MAY BE PLACED SINGLY OR JOINED TOGETHER IN GROUPS. WOVEN WIRE MESH GABIONS MAY BE STRETCHED WITH A SMALL WINCH BEFORE THEY ARE WIRED TO ADJACENT UNITS THAT HAVE ALREADY BEEN FILLED. UNDERWATER GABIONS, BY THEIR NATURE, ARE PRE-FILLED BEFORE THEY ARE PLACED BY CRANE.

THE CAGES SHOULD BE TIGHTLY FILLED WITH SOME OVERFILLING TO ALLOW FOR SUBSEQUENT SETTLEMENT. HORIZONTAL INTERNAL BRACING WIRES SHOULD BE FITTED BETWEEN THE OUTER AND INNER FACES AT 0.33 M CENTRES GABIONS WHICH ARE DEEPER THAN 500 MM. WHEN FILLED, THE GABIONS LIDS SHOULD BE PROPERLY CLOSED WITHOUT GAPS, AND WIRED DOWN. THE VERTICAL JOINTS BETWEEN INDIVIDUAL UNITS SHOULD BE STAGGERED IN ADJACENT COURSES, TO GIVE A BETTER APPEARANCE AND TO PREVENT THE FORMATION OF WEAK VERTICAL SHEAR PLANES. CURVES AND ANGLES IN THE FACE OF THE STRUCTURE MAY BE FORMED BY CUTTING AND FOLDING THE WIRE MESH TO MAKE SPECIALLY SHAPED UNITS.

6.2 MARINE APPLICATIONS

WHERE GABIONS ARE SUBJECTED WAVE ACTION, THERE SHOULD BE A MINIMAL AMOUNT OF MOVEMENT OF THE STONE FILLING INSIDE THE BASKETS. THE FILLING SHOULD BE TIGHTLY PACKED AND THE WIRE MESH SHOULD TAUT. IT IS GOOD PRACTICE TO OPEN THE BASKETS AFTER A FEW TIDES HAVE PASSES THROUGH THE WORK AND TO ADD STONE TO MAKE GOOD ANY SETTLEMENT THAT HAS OCCURRED IN THE FILLING. ANY LOOSE STONE LEFT OVER AFTER CONSTRUCTION SHOULD BE REMOVED AND NOT LEFT ON THE FORESHORE.

6.3 OTHER ENVIRONMENTS

WHEN WATER QUALITY IS IN DOUBT (PH BELOW 6 OR GREATER THAN 12) OR WHERE HIGH CONCENTRATION OF ORGANIC ACIDS MAY BE PRESENT, USE OF PVC (POLYVINYL CHRORIDE) COATED GABIONS IS RECOMMENDED.

7. SUBMISSION

DOUBLE-TWIST MESH IS DEMONSTRATED IN FIGURE 2. THE WIRE MESH DIMENSIONAL LAYOUT CAN BE SPECIFIED IN TABLE 6.

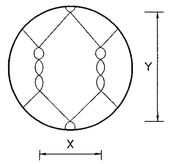

FIGURE 2 WIRE MESH DIMENSIONAL LAYOUT

TABLE 6 NOMINAL SIZE OF MESH TYPE "8"

NOMINAL MESH TYPE	X (mm)	Y (mm)	TOLERANCE (%)

6. SELVEDGES

THE CUT EDGES OF ALL MESH USED IN THE CONSTRUCTION OF GABIONS, EXCEPT THE BOTTOM EDGES OF END PANELS AND DIAPHRAGMS, SHALL BE FORMED MECHANICALLY WITH A SELVEDGE WIRE WHICH IS A LARGER DIAMETER THAN THE BODY WIRE.

AT LEAST TWO SELVEDGE WIRES ON EACH GABION BOX SHALL BE ADDITIONAL COATED WITH PVC AND UNIQUELY EMBOSSED WITH MANUFACTURER NAME APPROXIMATELY EVERY 500 MM.

7. DIAPHRAGMS AND END PANELS

THE END PANELS AND DIAPHRAGMS SHALL BE MECHANICALLY SELVEDGED ON THE TOP AND VERTICAL SIDES.

THE END PANELS SHALL BE ATTACHED BY MECHANICALLY TWISTING THE CUT ENDS OF THE MESH WIRES AT THE BOTTOM OF THE PANEL TO THE SELVEDGE WIRE ON THE BASE OF THE GABION.

SIMILARLY, THE DIAPHRAGMS SHALL BE CONNECTED TO THE BASE BY A SPIRAL WIRE PASSING IN TURN THROUGH MESH OPENINGS OF THE BASE AND EACH MESH OF THE DIAPHRAGM PANEL. THE WIRE FOR THE SPIRAL SHALL BE OF THE SAME TYPE OF THE MESH WIRE, BUT THE DIAMETER SHALL BE 2.20 MM IN DIAMETER.

8. LACING AND BRACING WIRE

THE DIAMETER OF THE LACING AND BRACING WIRE SHALL BE 2.20 MM. THE LACING WIRE SHALL BE SUPPLIED IN THE QUANTITY OF 5% OF THE TOTAL GABION WEIGHT TO ENABLE THE LACING AND BRACING TO BE UNDERTAKEN.

9. ROCK FILL

THE MATERIAL USED FOR GABION FILL SHALL BE CLEAN, HARD, DENSE AND DURABLE STONE, ROUNDED OR ANGULAR SHAPE.

NO ROCK SHALL EXCEED 250MM AND AT LEAST 85% BY WEIGHT OF THE STONES SHALL HAVE A SIZE EQUAL TO OR LARGER THAN 100 MM. NO ROCK SHALL PASS THROUGH THE MESH.

10. ASSEMBLY

PRIOR TO ASSEMBLY, THE GABION MATERIAL SHALL BE OPENED OUT FLAT ON THE GROUND AND STRETCHED TO REMOVE ALL KINKS AND BENDS (FIGURE 3 (A)).

THE GABION BOXES SHALL BE ASSEMBLED INDIVIDUALLY, BY RAISING THE SIDES, ENDS AND DIAPHRAGMS, ENSURING THAT ALL CREASES ARE IN THE CORRECT POSITION AND THAT THE TOPS OF ALL FOUR SIDES AND THE DIAPHRAGMS ARE EVEN.

THE FOUR CORNER EDGES OF THE GABION BOXES SHALL BE LACED FIRST, FOLLOWED BY THE EDGES OF INTERNAL DIAPHRAGMS TO THE SIDES (FIGURE 3 (B)).

IN ALL CASES, LACING SHALL COMMENCE BY TWISTING THE END OF THE LACING WIRE TIGHTLY AROUND THE SELVEDGE. IT SHALL THEN PASS ROUND THE TWO EDGES BEING JOINED USING ALTERNATE SINGLE AND DOUBLE LOOPS AT 100MM INTERVALS AND BE SECURELY TIED OFF AT THE BOTTOM. THE ENDS OF ALL LACING WIRES SHALL BE TURNED TO THE INSIDE OF THE BOX ON COMPLETION OF EACH LACING OPERATION (FIGURE 3 (C) AND 3 (D)). EACH LOOP SHALL BE PULLED TIGHT TO PREVENT THE JOINT OPENING DURING FILLING. TIGHTNESS OF THE LACING IS ESSENTIAL.

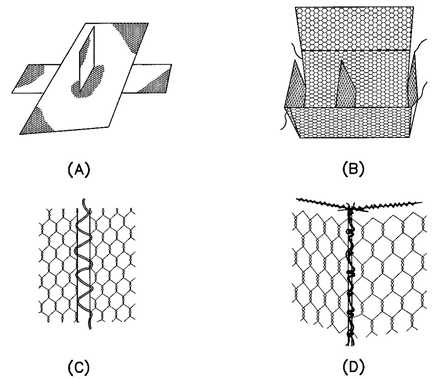

FIGURE 3 GABION ASSEMBLY

11. ERECTION

ASSEMBLED BOXES, OR GROUPS OF BOXES, SHALL BE POSITIONED IN THE STRUCTURE. THE SIDE, OR END, FROM WHICH WORK IS TO PROCEED, SHALL BE SECURED EITHER TO THE COMPLETED WORK, OR BY RODS OR STAKES DRIVEN INTO THE GROUND AT THE CORNER. THESE STAKES MUST BE SECURED AND REACH AT LEAST TO THE TOP OF THE GABION BOX.

FURTHER GABION BOXES SHALL BE POSITIONED IN THE STRUCTURE AS REQUIRED, EACH BEING SECURELY LACED TO THE PRECEDING ONE ALONG ALL COMMON CORNERS AND DIAPHRAGMS (FIGURE 4).

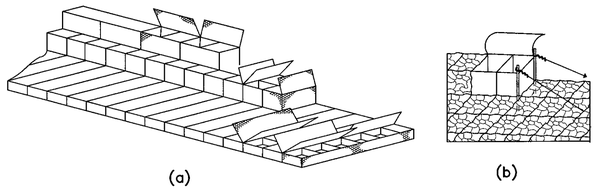

FIGURE 4 GABION ERECTION

12. STRETCHING

FINAL STRETCHING OF THE GABION BOXES SHALL BE CARRIED OUT USING A PULL-LIFT OF AT LEAST ONE TON CAPACITY, FIRMLY SECURED TO THE FREE END OF THE ASSEMBLED GABION BOXES (FIGURE 4 (B)).

WHILST UNDER TENSION, THE GABION BOXES SHALL BE SECURELY LACED ALONG ALL EDGES (TOP, BOTTOM AND SIDES) AND AT DIAPHRAGM POINTS, TO ALL ADJACENT BOXES.

13. FILLING

FILLING SHALL BE CARRIED OUT WHILST GABION BOXES ARE UNDER TENSION.

THE FRONT FACE AND ALL OTHER FACES WHICH WILL BE EXPOSED IN THE COMPLETED STRUCTURE SHALL BE "HAND PACKED" WITH THE STONES PLACED SO AS TO PRODUCE A NEAT FACE FREE FROM EXCESSIVE BULGES, DEPRESSIONS AND VOIDS.

INTERNAL BRACING WIRES SHALL BE PROVIDED ON THE EXPOSED FACES AT THE RATE OF 4 NOS./CU.M AT 0.33 M VERTICAL CENTERS IN 1 M HEIGHT GABION BOX TO PREVENT DISTORTION OF THE GABION UNITS DURING FILLING AND IN THE COMPLETED STRUCTURE (FIGURE 5 (A)). THESE BRACING WIRES SHALL BE WRAPPED AROUND TWO OF THE MESH WIRES (FIGURE 5 (B)) AND EXTEND FROM FRONT TO BACK. ADDITIONAL BRACING WIRES SHALL BE PROVIDED ON EXPOSED ENDS AT A RATE OF 4 NOS./SQ.M OF FACE.

GABION BOXES SHALL BE FILLED UP IN STAGES AND HORIZONTAL BRACING WIRE INSERTED AS FILLING IS BROUGHT UP.

MECHANICAL FILLING EQUIPMENT MAY BE USED WITH THE APPROVAL OF THE ENGINEER AND PROVIDING ADEQUATE PRECAUTIONS ARE TAKEN TO PROTECT THE PVC COATING FROM ABRASION DURING FILLING OPERATIONS.

TENSION ON THE GABION BOXES SHALL BE RELEASED ONLY WHEN FULLY LACED AND SUFFICIENTLY FULL TO PREVENT THE MESH FROM SLACKENING.

ALL GABIONS SHALL BE OVERFILLED BY 25MM USING FLAT STONE TO ALLOW FOR MINOR SETTLEMENT AND TO PROVIDE A LEVEL SURFACE FOR SUBSEQUENT LAYERS.

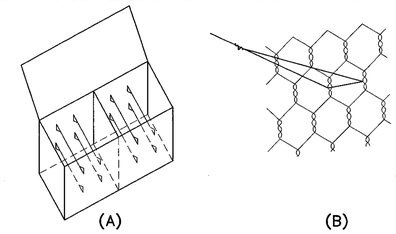

FIGURE 5 ROCK FILLING TECHNIQUE

14. FINAL LACING

CLOSING AND LACING DOWN OF LIDS SHALL PROCEED AS SOON AS PRACTICABLE AFTER FILLING OPERATIONS ESPECIALLY IF EXPOSED TO THE LIKELIHOOD OF STORM OR FLOOD DURING CONSTRUCTION.

LIDS SHALL BE STRETCHED TIGHT OVER THE FILLING WITH SUITABLY DESIGNED CLOSING TOOLS AND LACED DOWN SECURELY THROUGH EACH MESH ALONG ALL EDGES, ENDS AND DIAPHRAGMS USING THE LACING METHOD DESCRIBED ABOVE BEFORE COMMENCING WORK ON THE NEXT LAYER OF GABION. THE ENDS OF ALL TYING AND BRACING WIRES SHALL BE TURNED INTO THE GABION BOX ON COMPLETION OF EACH LACING OPERATION.

NOTES

1. ALL DIMENSION ARE IN METERS UNLESS OTHERWISE INDICATED.
2. SUBDRAIN IS USED FOR LOWERING GROUNDWATER TABLE TO PREVENT SEEPAGE UNDER ROAD SURFACE, GENERALLY INSTALLED AT TOE OF BACK SLOPE AND BENEATH SIDE DITCH
3. TWO OPTIONS OF SUBDRAIN OPTION "A" AND OPTION "B" CAN BE USED
4. SELECTION OF SUBDRAIN SHOULD BE CONSIDERED
   - 4.1 OPTION "A" IS SUITABLE FOR SOIL FOUNDATION, EASY FOR EXCAVATION OR SHALLOW GROUNDWATER TABLE (DEPTH LESS THAN 2.0 M)
   - 4.2 OPTION "B" IS SUITABLE FOR WEATHERED ROCK OR HARD SOIL FOUNDATION, DIFFICULT FOR EXCAVATION OR GROUNDWATER TABLE IS DEEPER THAN 2.0 M
5. CONSTRUCTION OF SUBDRAIN OPTION "B" THE DRAIN HOLE SHALL BE DRILLED TO THE GROUNDWATER TABLE OR AS DIRECTED BY THE ENGINEER, THEN POUR SAND FILTER (100% PASS SIEVE 9.5 MM AND PASS SIEVE NO.200 LESS THAN 5%) OR ROCK FILTER WITH 9.5–19 MM DIAMETER INTO THE DRAIN HOLE
6. THE MINIMUM DIAMETER OF LONGITUDINAL DRAINAGE PIPE IS 0.10 M. INSTALLED WITH A GRADIENT OF ABOUT 1–2%
7. INSTALL GROUNDWATER PRESSURE RELIEF HOLE ON SIDE DITCH EVERY 50 M ALONG THE DITCH OR AT THE LOCATION WHERE THE DISTANCE TO DRAIN CHUTE IS MORE THAN 50 M. AFTER DRILLING FILL THE TOP OF HOLE WITH GRAVEL
8. DETERMINATION OF FLOW AND QUANTITY OF GROUNDWATER AT SPECIFIC LOCATION IS NOT SIMPLE BECAUSE THE FLOW QUANTITY AND FLOW RATE IS VARIED WITH SEASON. DECISION TO USE THIS DRAWING CAN BE MADE BY EXCAVATING A DITCH WITH 1.00–1.50 M DEPTH AT TOE OF BACK SLOPE, LEFT IT OPEN AND CHECK, IF THERE IS GROUNDWATER SEEPAGE OR NOT
9. OTHER TYPES OF SUBDRAIN CAN BE SELECTED TO SUIT THE SITE CONDITION AS DIRECTED AND APPROVED BY THE ENGINEER
10. SLOT GROOVING CAN BE USED INSTEAD OF DRILLING HOLES, FOR LONGITUDINAL DRAINAGE PIPE THE GROOVING AREA SHALL NOT BE LESS THAN THE DRILLED AREA AS APPROVED BY THE ENGINEER

NOTES

1. ALL DIMENSION ARE IN METERS UNLESS OTHERWISE INDICATED
2. HORIZONTAL DRAIN IS USED FOR LOWERING GROUND WATER TABLE TO INCREASE SLOPE STABILITY.
3. IF NECESSARY, SOIL INVESTIGATION AND SLOPE STABILITY ANALYSIS SHALL BE CARRIED OUT TO VERIFY THE SLIP PLANE BEFORE THE INSTALLATION OF HORIZONTAL DRAIN.
4. SINCE SLOPE MOVEMENT CAN BE OCCURRED ALONG BOUNDARY OF SOIL /BEDROCK AND HIGHLY WEATHERED ROCK/MODERATELY WEATHERED ROCK, PERPENDICULAR SOIL DRILLING SHALL BE CARRIED OUT (AT LEAST 1 BOREHOLE) AT THE SLOPE WITH POTENTIAL FOR FAILURE TO VERIFY THE BOUNDARY.
5. THE MINIMUM DIAMETER OF HORIZONTAL DRAIN IS 0.1 M INSTALLED WITH A INCLINATION OF ABOUT 5–10 DEGREES (SEE FIGURE 1)
6. THE CONTRACTOR SHALL PROPOSE DRILLING PLAN AND TYPE OF DRILLING MACHINE FOR INSTALLATION OF HORIZONTAL DRAIN DRILLING. IF THE SOIL IN THAT AREA IS COMPOSED OF GRAVELLY SOIL, IT IS NECESSARY TO INSTALL CASING TO PREVENT COLLAPSE OF DRILLING HOLE.
7. SPACING OF HORIZONTAL DRAIN HOLE IS 5.00 M MAX. (SEE FIGURE 3)
8. PERFORATED P.V.C. PIPE CLASS 13.5 WITH 125 MM DIAMETER WRAP AROUND WITH NON–WOVEN GEOTEXTILE (WEIGHT > 200 G/M^2) SHALL BE USED FOR HORIZONTAL DRAIN.
9. DETERMINATION OF FLOW AND QUANTITY OF GROUND WATER AT SPECIFIC LOCATION IS NOT SIMPLE BECAUSE THE FLOW QUANTITY AND FLOW RATE IS VARIED WITH SEASON. DECISION TO USE THIS DRAWING CAN BE MADE BY INSTALLATION OF OBSERVATION WELL ON CUT SLOPE AND CHECK FOR GROUNDWATER TABLE.

DETAIL OF PLANTING SOIL LAYERS

METHOD OF TRANSPLANTING TREE

1. TRIMMING UNNECESSARY BRANCHES TO REDUCE VAPORIZATION OF THE TREE

1.1 CUT MINOR BRANCHES AND LEAVE THEM ABOUT 2"
1.2 SPRAY THE CUTS WITH PAINT OF SPREAD WITH BETEL NUT TO PREVENT FUNGAL INFECTION

2. DIGGING AROUND THE TREE TO REMOVE

2.1 TOOLS USED ARE A HOE, A SPADE AND A CROWBAR
2.2 BIGGER OR MORE COMPLICATED GARDENING EQUIPMENT MAY BE USED FOR BIGGER TREES
2.3 DIG AROUND THE TREE – 50 CM. AWAY FROM IT AND 60 CM. DEEP USE THE CROWBAR TO CUT OFF ONCE THE MINOR ROOT
2.4 ADJUST THE SOIL AND MAKE THE SHAPE OF A CUP (DO NOT CUT THE TAPROOT)
2.5 WRAP AROUND THE TRUNK WHICH IS BEING COVERED WITH CUP–SHAPED SOIL, WITH THE GUNNY – SACKS SEW THEM TOGETHER IF TWO OR THREE GUNNY – SACKS ARE USED. TIE UP THE GUNNY – SACKS TIGHTLY WITH 30–50 ROPES USED TRIPOD TO HOLD UP THE TRUNK AT LEAST 21 DAY. (SOME KINDS OF TREE DO NOT) WATERING THE GUNNY – SACKS, NOT LET TO DRY.
2.6 AFTER 21 DAYS EXAMINE THE TREE, IF IN SUITABLE STATE, DIG INTO THE GROUND FOR ANOTHER 10–20 CM. CUT THE TAPROOT WITH A CROWBAR. WHILE IN THIS STEP, DO IT QUICKLY TO PROJECT THE REST OF THE TREE.

3. REMOVING

3.1 WRAP AROUND THE TRUCK WITH GUNNY – SACKS.
3.2 LIFT THE TREE FROM THE GROUND BY CRANE – TRUCK OR TRIPOD AND HELP WITH MAN.
3.3 LAY THE TREE DOWN ON THE BACK OF TRUCK. UNDER THE TREE ARE PIECES OF GUNNY – SACKS PUT TO PROJECT THE TREE IF THE TREE IS LINGER THAN THE BACK OF TRUCK, LAY THE BRANCHES–SIDE ON THE TRUCK' S ROOF AND THE CUP–SHAPED SIDE IN THE TRUCK.

4. PRE – TRANSPLANTING

4.1 BEFORE TRANSPLANTING , THE TREE SHOULD BE PUT TO REST IN THE GREENHOUSE ABOUT 1 MONTH FOR SOFTWOOD OR 3 MONTHS FOR HARDWOOD. COVER THE CUP – SHAPED PART WITH COCONUT FUZZ AND TILL THE LEAVES GROW.
4.2 THE TREE MAY BE PUT ANYWHERE OTHER THAN IN THE GREENHOUSE AS LONG AS THERE IS NO STRONG SUNLIGHT

5. PLANTING

5.1 PREPARE A HOLE OF SIZE 1.00x1.00x1.00 M.
5.2 FILL THE HOLE WITH THE EXISTING SOIL WHICH IS USED AS BASE 40 CM. THICK. PUT THE TREE ON THE BASE SURFACE AND THE CUP–SHAPED PART IS AT THE SAME LEVEL AS THE EXISTING GROUND AT TOP OF THE HOLE
5.3 BEFORE FILLING THE HOLE, USE DILUTE LYSOL SOLUTION TO PREVENT FUNGAL INFECTION BY POURING THE DILUTED LYSOL SOLUTION ON THE CUP–SHAPED PART OFTHE TREE THEN FILL THE HOLE WITH THE EXISTING SOIL AND COMPACTED LOOSELY UNTIL THE SOIL IS AT THE SAME LEVEL AS THE CUP–SHAPED PART
5.4 BUILD GROUND CURB AROUND THE TREE. THIS MAKES A CIRCLE WITH A RADIUS OF 1 METER. THE CURB WILL HELP PRESERVE WATER.
5.5 USE TRIPOD TO SUPPORT THE TREE.

6. MAINTENANCE

6.1 WATERING SHOULD BE DONE IN THE MORNING AND EVENING.
6.2 WATER SPRAYING (BY SPRINGER) SHOULD BE DONE FROM THE TOP TO THE BOTTOM OF THE TREE (VERTICALLY).
6.3 IT USUALLY TAKES ONE MONTH FOR YOUNG LEAVES TO COME OUT DEPENDING UPON THE KINDS OF TREES. IN THE MEAN TIME, THE TREE WILL ALSO NEED VITAMIN B–1 AT THE MORNING AND EVENING TWICE A WEEK
6.4 AFTER ONE MONTH, FERTILIZER (15 – 30 – 15)' SHALL BE GIVEN.
6.5 IF IT IS DIFFICULT TO WATER THE TREE SINCE IT IS GROWN ON HARD SOIL SUCH AS LATERITE SOIL, THE P.V.V. PIPE ø2 1/2" WHICH IS 30 CM. LONG WITH DRILLED AT BOTTOM PART ø 5 MM. WITH 10 CM. APART SHALL BE BURIES WATER WILL BE SENT THROUGH THE P.V.C. PIPE TO THE ROOTS
6.6 THE TREE WILL GROW IN ABOUT 3 MONTHS AND WILL COMPLETELY GROW IN ONE YEAR.

NOTES ;

1. ALL DIMENSIONS ARE IN METERS UNLESS OTHERWISE INDICATED.
2. TREE TO BE TRANSPLANTED FROM THE AREA OF CONSTRUCTION ARE TREES THAT ARE IMPORTANT TO BE RESERVED AS DIRECTED BY THE ENGINEER.
3. THE ENGINEER WILL ASSIGN A NEW LOCATION TO PLANT OUT OF ROADBED
4. WHEN THE TRANSPLANTING ARE FINISHED, THE CONTRACTOR SHALL TAKE CARE OF THE TREES UNTIL THEY ARE BIG ENOUGH.
5. THE DEPARTMENT OF HIGHWAYS SHALL PAY ACCORDING TO THE SIGNS OF THE GROWTH OF THE TREE. IF THE TREES DIE, THE DEPARTMENT OF HIGHWAYS SHALL PAY ACCORDING TO ROADWAY EXCAVATION EXCAVATION (EARTH). THE NUMBERS OF THE HOLES SHALL BE TAKEN INTO ACCOUNT.
